

FRICITION CLUTCH K90TF

FRICITION CLUTCH K90/4TF

With the newly developed friction clutches K90TF and K90/4TF, Walterscheid for the first time provides the opportunity to extend the use of existing clutch lining reserves. Particularly for applications where there is only little to moderate clutch strain, this is an interesting alternative. So far, the only way was to have the clutch adjusted either by the manufacturer or by specially authorised service partners. With the K90TF and K90/4TF, however, local dealers of agricultural machinery can now take care of adjusting the clutch for the first time.

K90TF and K90/4TF clutch models are based on the proven K90 and K92 series. The driveline is effectively protected against high starting torques and occurring torque peaks. The clutch can also be easily and effectively released after longer downtimes.

Advantages of K90TF and K90/4TF

- > Easy and user-friendly ventilation (no measurements needed before and after venting)
- > Easy exchange of clutch linings
- > Defined and reproducible dimension setting by means of classified spacer tubes
- > Due to the plate spring characteristics, lining wear is compensated for – thus maximising service life
- > Combinable with overrunning clutch
- > Very constant torque
