

Drive Shaft Guard ST

Drive Shaft Guard ST

The drive shaft guard ST consists of the new profiled guard tubes ST in combination with the proven guard components of the SC/SD series (such as guard cones and bearing rings).

The new drive shaft guard ST with profiled guard tubes complies with international safety regulations.

In all applications where SC/SD guard tubes are used today, the new ST guard tubes can be used tomorrow without any problem.

The advantage of profiled guard tubes is that the inner and outer guard tubes cannot rotate due to the interlocking ribs. As a consequence, one of the retaining chains of guard is no longer required.

The risk of damaging the drive shaft guard due to an improper chain attachment is reduced.

A great gain for your safety because a defective guard does not protect you from the rotating driveshaft.
